

**University of Minnesota Duluth  
Department of Civil Engineering Writing Guide**

Last updated on July 23, 2021

## **Preface**

This guide clarifies written communication expectations in the civil engineering discipline and defines requirements for work submitted to the University of Minnesota Duluth (UMD) Department of Civil Engineering. This supplements your required writing courses, WRIT 1120 and WRIT 3130. It is not meant to replace the lessons you learn in those courses, only to provide civil engineering specific advice based on conventions and professional practices of civil engineers. However, you should remember that writing is dependent on purpose, author, and audience. Therefore, this guide provides baseline instruction and may not perfectly match your future employers' needs. Nevertheless, the overall emphasis of clear, concise, professional presentation of information that is easily understood by your audience will match your future employers' expectations.

The writing guide that follows was developed by Civil Engineering faculty and faculty consultants from the University's writing center who have taught writing at UMD. All Civil Engineering faculty have reviewed this document and provided feedback. The Department expects that you will prepare your work for this department according to this guide, but this is a living document and will continue to change. You can find updated versions of the guide on the department's website. If you have feedback or suggestions for improvement, please contact the Department Head, Dr. Adrian Hanson at [athanson@d.umn.edu](mailto:athanson@d.umn.edu) or 218-726-6438. Alumni feedback based on professional experience is especially appreciated.

# Table of Contents

<b>General Guidelines.....</b>	<b>1</b>

## **General Guidelines**

While Civil Engineering faculty members expect you to prepare your written communication according to this guide, individual instructors will adjust requirements for particular assignments. When in doubt, check with your instructor.

## **Format**

When preparing work for your classes, follow the instructor's specific guidelines as well as these general formatting principles:

- Print your work on a high quality printer.
- Format your writing in 11- or 12-point Times New Roman font. This guide uses 12-point Times New Roman.
- Single-space within paragraphs and double-space between paragraphs.
- Create 1-inch margins on all sides of the page.
- Number each page except the first.
- Staple or clip multiple pages.
- Label each section with the appropriate heading.

## **Sentence and Paragraph Structure**

Of course, you should be sure that your writing is grammatically correct, but you should also follow these guidelines:

- Begin each paragraph with a topic sentence.
- Place the main topic of each sentence in the subject position.
- Avoid one-sentence paragraphs.
- Avoid starting a sentence with a numeral, acronym, or symbol.
- General convention for professional civil engineering writing is to use active voice because it is more direct and concise. See Appendix A for more detail.
- Check with your writing instructors or online sources for further guidance on these issues.

## **Additional Resources**

The UMD Writers' Workshop provides free, individual appointments with graduate student and faculty writing consultants. Walk-in consultations are available on a first-come-first-served basis. You can make appointments on the Writers' Workshop website (<http://www.d.umn.edu/writwork/main/>).

The Purdue Online Writing Lab (OWL) (<https://owl.english.purdue.edu/owl/>) provides a variety of resources. While general guidelines are provided, specific topics are also addressed.

## Homework

The purpose of homework is not only for you to practice applying engineering concepts, but also develop the habit of presenting your work in a clear and orderly manner so that other people can follow what you are doing. This is a critical skill you must master as an engineer. Consider the following when preparing your homework:

- All homework must be on engineering paper with a maximum of one problem per page.
- Each page should include the student's name, class title and number (CE XXXX), the date, homework set and problem number.
- Each page should also be numbered.
- Begin each problem with a detailed description of the problem; copied directly from the assignment sheet if necessary, this information should be labeled as "Given."
- If a diagram or drawing is given, it should be recreated using a straight edge and it should include all details.
- Clearly indicate the purpose of the problem, what you are being asked to find. This should be labeled as "Find."
- Your solution should be labeled as such ("Solution") and should be presented in a way that is easy to follow.
- If you are using a formula derived in class or in a text, write out the formula in its basic form (using variables) before substituting numbers. Do not skip steps and give each new equation or step a line of its own.
- Always use units and significant figures.
- If another diagram is necessary for you to complete the solution, draw it, again using a straight edge and label all dimensions and properties.
- When a requested answer is reached, be sure to clearly indicate it with a straight-edge box drawn around it, double underline, or similar emphasis.

## **Professional Communication**

The follow section describes three common methods of communicating in professional settings: memorandums, email, and business letters. Memorandums will be required in course work and in professional settings after graduation and likely during internships. Expectations of professional emails are significantly different than personal email communication. Finally, business letters will be used during your job search and in professional settings.

### **Memorandums**

Memos bring your audience's attention to a particular issue. There are five main parts to a memo: the heading, opening, body, closing, and necessary attachments. An example of a memo appropriate for engineering applications follows.

Guidelines for the heading section:

- The header must include the following items: Date, To, From and Subject.
- Each item gets its own line and the description of each item must be left justified and aligned.
- You may include the company or department of the recipient and sender in a line directly below the specific name.
- It is customary for the sender to sign the memo next to their name in the heading.
- The subject line should be written such that the recipient will understand the topic of the memo at a glance.

Guidelines for the opening:

- The memo opening explains the purpose of the memo and a brief description of the context, problem, and/or tasks that the memo addresses. In some situations, the opening may be the first sentence of the body.

Guidelines for the body:

- The body of the memo should be well organized and concisely written.
- Use a new paragraph for each main point.

Guidelines for the closing:

- The closing typically includes a recommendation or suggested action.
- Include contact information necessary for the recipient to get in touch with the sender, such as a phone number or e-mail address. There is no letter-style closing or signature at the end of a memo.

Guidelines for attachments:

- If another document will accompany the memo, it must be referred to in the body of the memo and be listed below the body as an attachment.
- The memo should be shared with anyone affected by or mentioned in the body; these people should be listed in the Cc: line.

## Sample Memo

**To:** Dr. Awesome Professor  
Department of Civil Engineering, UMD  
**From:** Sally Student *Sally Student*  
**Date:** September 30, 2015  
**Subject:** Sustainable Design and Construction Project Update

My team met with the City of Duluth to discuss the Solar Garden class project on September 26. At the meeting we discussed the size, type and placement of the array as well as potential funding sources.

We created a list of potential installers in Northern Minnesota and shared our preliminary solar insolation calculations with the City. Please find summaries attached.

The next meeting with the City of Duluth is on October 4. Please let me know if you know of any other installers in the area. If you have any questions on the subject of this memo, please contact me at [stude014@d.umn.edu](mailto:stude014@d.umn.edu) or 218-867-5309.

**Attachments:**

Attachment 1 – Potential solar installers in Northern Minnesota

Attachment 2 – Preliminary solar insolation calculations for solar garden site

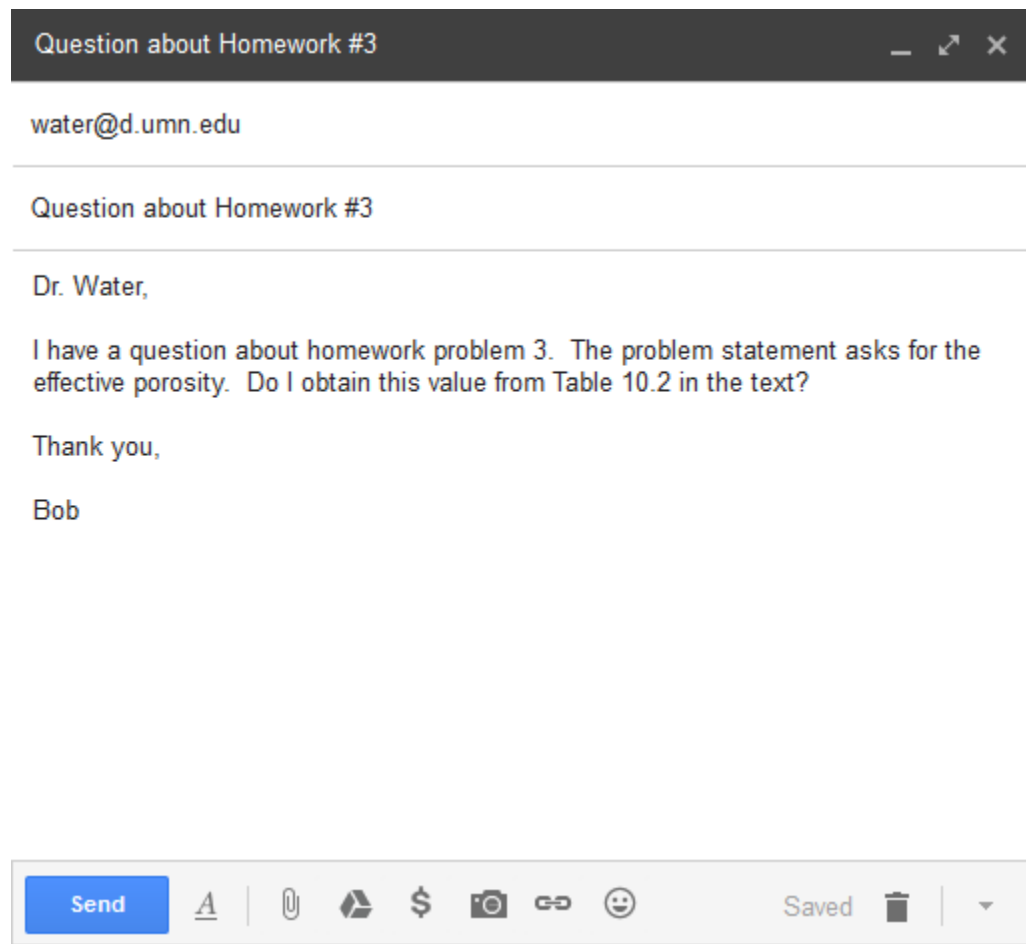

**Cc:**

Mayor Jones, City of Duluth

## Professional E-mails

In your career as an engineer you will write numerous e-mails. Practical experience writing these e-mails starts in school. When communicating with your professors, internship supervisors, or even partners on class projects, communicate professionally. The following is a list of considerations for a professional e-mail:

- Use a descriptive subject line (e.g. “Question about Homework 3”).
- Avoid being too casual with your greeting. Avoid starting your e-mail with “Hey!” Unless you are certain it is appropriate to do otherwise, refer to the recipient formally, using their title and last name (i.e. Dr. Water, Ms. Technician, Mr. Librarian, etc.).
- State the purpose for your e-mail in the first line. “I have a question about the third homework problem.”
- End with a closing, such as “Thank you,” “Best Regards,” or “Sincerely.”

## **Business Letter**

Business letters are a formal way to communicate with another professional. There are eight main parts to a business letter: the sender's address, date, inside address, salutation, body, closing, enclosures and typist initials. An example of a business letter appropriate for engineering applications follows.

Guidelines for the sender's address section:

- If you are using letterhead that includes your address, you do not need to repeat it.
- If you are not using letterhead that includes your address, add your address to the top of the letter.
- Do not include your name or title; just include the street address, city, state and zip code.

Guidelines for the date section:

- Include the date that the letter was finished in the following format: January 1, 2015.
- The date is typically left justified.

Guidelines for the inside address section:

- Address the letter to a specific individual at the company you are writing to.
- Be sure to include a specific title such as Ms., Mrs., Mr. or Dr. If you are unsure if a woman should be addressed as Ms., Mrs., or Miss, default to Ms.
- Use the U.S. Post Office format for the address.
- The inside address should be typed one line below the date.

Guidelines for the salutation section:

- Include a personal title and use the same name as in the inside address. Only use a personal title (first name) if you usually use it to address them. Add a colon after the salutation. An example is: Dear Mary:
- If you don't know the addressee's gender, you can add their job title followed by their last name or include their full name. An example is: Dear Alex Smith:

Guidelines for the body section:

- Use single spacing in the body of the letter and leave a space between each paragraph.
- Be concise.
- The first paragraph usually consists of a friendly opening, followed by the main point of the letter.
- The following paragraphs should include justification, background information and supporting details.
- The last (closing) paragraph should provide a restatement of the point of the letter and request action if necessary.

Guidelines for the closing section follow:

- The closing should be included one line below the last body paragraph. An example is: Thank you.

- Leave four lines after the closing before including the sender's name and signature. If there is a colon used in the salutation, then there should also be a comma following the closing.

Guidelines for the enclosures section follow:

- Use this section to mention any enclosures that accompany the letter.
- List the enclosures one line below the closing.
- You may list each item to make sure that each document is accounted for.

## Reports

The purpose of a civil engineering report is generally to inform your audience, although some reports may describe or argue. This may include presenting design results, proposing a solution to a problem, or presenting research results. The following presents a typical five section organization, preceded by a summary. The sections include an introduction, background, methods/material, results and analysis, and conclusion. Italics mean the element could be optional.

### Executive Summary/Abstract

This section provides a condensed overview of the motivation for the report, problem which gave rise to the work, technical objectives of the project, *the methodology/procedures*, the results or findings, and the conclusions and recommendations. These terms will be defined in the following sections. This may be a single paragraph or several pages depending on the nature of the report. If you have questions, see your instructor for more details.

There is an important distinction between the executive summary and the sections that follow in the report. The executive summary contains sufficient information such that an informed reader can read it and generally understand conclusions of the report. It contains enough information that a less well-informed reader can get the general sense of the report contents, then easily find specific information in the sections that follow. The rest of the report includes the motivation, problem, work/technical objectives, but with more detail than the executive summary, such that less well-informed readers can get more information than was included here.

### Introduction

The purpose of the introduction is to orient the audience to the project and prepare the reader to understand the rest of the report. It includes the following components:

- Motivation, but with more detail than the summary. The motivation is why you conducted the work
- Problem or need which gave rise to the work, but with more detail than the summary. The problem is the specific problem or question your report seeks to answer.
- Technical objectives of the work, but with more detail than the summary. The technical objective of the research/test/design is the technical measures that need to be determined in order to answer the client's question.
- Document purpose statement [i.e. "The purpose of this document is to present the methods, findings, conclusions and recommendations."]
- *Contents statement. [i.e., a description of what will follow]*

### Background/Literature Review

The purpose of this section is to familiarize your audience with context necessary to understand

the reason you chose your methodology. Use tabular or graphical summaries whenever possible. See the sections in this guide on figures, tables, and equations for more detail. This section is often omitted in laboratory reports.

This section may include subsections, depending on the length of the report and the depth of discussion. You may include:

- A summary of previous research leading to your work
- A description of permits and/or regulations
- An explanation of constraints affecting the project
- A map locating the project

### **Methods**

This section presents a description of testing material and methodology. The methodology or procedures are the specific tasks done to achieve the technical objectives.

An example of description of testing material for soils is a description of the sample as in a field or visual examination using geologic or common names, if known. This component of the methods section may not apply to design or research reports.

The methodology must be valid and specifically explained so that it can be replicated. Assumptions should be clear to your audience. For experimental work, ASTM standard numbers and titles (explained in more detail during CE 3xxx level classes) or a brief synopsis are usually adequate for standard civil engineering testing. Detailed experimental procedures can be included as an attachment. For reports describing non-experimental work, a description of your design, assumptions, or research process is appropriate. Use figures, tables, and equations as appropriate.

### **Results and Analysis**

The purpose of this section is to present specific data generated by the methodology and an analysis or interpretation of the data. This material is typically summarized in the report proper with details of experimental results or example calculations from a design process presented in an appendix. Use tabular or graphical summaries whenever possible. See the sections in this guide on figures, tables, and equations for more detail.

You should explain the meaning of the results in regard to the technical objectives. The results are the findings that determine the technical measures. This section may include subsections, depending on the length of the report and the depth of discussion. You should include:

- A discussion of the relation of the results to the technical objectives
- Important correlations (if any)
- Errors, if they significantly affect conclusions

- Your conclusion and the reasons for your conclusion. The conclusions are the answers to problem; they may be indeterminate if the results are not conclusive. If the error is significant, there cannot be an answer to the client's problem based on these results.
- Your recommendations and reasons for your recommendations. The recommendations are additional points the audience should have to achieve to solve the problem.

### **Conclusions and Recommendations**

Provide statements of what you have found out in regard to both technical objectives and the problem which gave rise to the work. They present your best professional judgment of the reliability and limits of your conclusions and recommendations. There should be no new content in this section. This section is a restatement of what has already appeared in the report.

*Recommendations may answer the problem, endorse some action, or make some statement related to the process that is not addressed in the original work requested. There should be no new content in this section. This section is a restatement of what has already appeared in the report.*

### **References**

The reference page should include articles, text books, ASTM standards, lab manuals, or any other reference used to complete the work. Follow the format shown in the reference section of this manual.

### **Appendices**

If you have appendices, you must refer to each of them in the course of the report proper. Begin with a separate page, listing each section and the figures or tables appearing in each section. The sections of the appendices should be arranged in the order they were referenced in the report. An index should be included in the appendix cover page. The first page of each section should begin with a label for that section.

Material of a highly detailed nature should be attached in an appendix. Depending on the project, the documentation could include:

- Raw data
- Sample calculations
- Unusually detailed graphs (Standard graphs that summarize the results go in the main body of the report.)
- Detailed test descriptions and any major modifications to the standard test procedures.

## Graphic Aids and Equations

The follow section describes equations and two common methods of presenting data: figures and tables. Figures, tables, and equations will be a common part of your written communication in engineering. The guidelines presented below focus on printed communication, but the same principles apply to handwritten communication, such as what you will commonly prepare for homework.

### Figures

The purpose of figures is to present a great deal of information in an easily accessible way. Figures are usually a more efficient means of conveying technical information than describing the same information in words.

#### Data Presentation

When using a figure, be sure to reference the table in the text prior to the inclusion of the table. Refer to the figure by the number assigned to it. For example, Figure 1 shows an example of how graphs should be presented. It is important to explain the relevance of the figure in the text and also to give the reader context. Key points on graphs include:

- Presenting data
  - Measured data should appear as a point. Relationships from theory or trends appear as solid lines without visible data points.
  - If data points plot near one another, plotting the points as hollow shapes allows the audience to distinguish one point from another, while filled points hide other data.
  - Color is a good way to distinguish between different data sets on one plot, but remember that your documents may be printed in black-and-white. When possible, ensure that your audience can understand your plot without color.
  - Lines between data points imply knowledge of behavior between measured points. Ensure that this is case before choosing to connect data points.
  - Grid lines can be distracting. Ensure that grid lines are necessary before including them in your plots.
  - At times, labels may help the audience interpret the data. For example, highlighting a measured point or point on a trend may draw your audience's attention to the main point of the figure. When including labels, ensure that they are legible, neat, and professional in appearance. Do not clutter the figure with labels.
- Axes
  - Without labeled axes, figures do not help the audience understand your data. The American Society of Civil Engineers (ASCE) convention for labeling axes is: Property, symbol (units). An example is "Depth,  $z$  (ft)." Some of your textbooks label axes with only a symbol and units. Depending on your audience, this may be appropriate; however, for work in this department, follow ASCE convention.

- Ensure an appropriate number of significant figures. Too many significant figures implies a level of detail your data may not support.
- The font size should be large enough to guarantee ease of reading.
- Axes stand out and present a cleaner figure if the axes are black, some software packages (i.e. Excel) default to a gray axis. If necessary, change the axis color to black.
- ASCE convention is for tick marks to appear on the inside of the axis. It is acceptable, but not required, for major unit tick marks to cross the axis. Avoid using outside tick marks.
- Legends
  - You should only include legends when necessary. For example, the example data shown in Figure 1 should not include a legend as it contains only one stress-strain relationship. If you need to present results from several types of clay, a legend would be appropriate.

**Figure 1.** Reconstituted Gold Art clay unconfined compression test results.

### Pictures

Another common type of figure is a picture. As shown in Figure 2, ensure that pictures are clear and easily understood. This picture shows a common piece of geotechnical *in situ* testing equipment. Key points to consider include:

- Show an easily identified object for scale (i.e., a pen is shown in Figure 2).
- Ensure the background is clear and professional.

- Size the picture appropriately. If the picture is too large, pixilation will detract from the appearance, while a small picture will not provide necessary detail.
- Labels highlighting an important aspect of the picture should be clear and easily read (i.e. appropriate font size, font color that does not blend into the background, etc.). Avoid cluttering your picture with an excessive number of labels.

**Figure 2.** Disassembled cone penetrometer (Saftner and Hryciw, 2015).

### Drawings

You may need to present engineering drawings, including diagrams of equipment or drawings produced in a CAD program. Figure 3 shows an example of a steel connection from the AISC Steel Construction Design Examples. Important points to highlight in this figure include:

- Size the drawing so all parts of the drawing are easily understood.
- Ensure that the font size in all labels is legible.

### Maps

Maps are frequently included in engineering reports, orienting the audience to the project area. Figure 4 is a map of the UMD campus. Important points to highlight in this figure include:

- Location of map area is clear. Referencing Figure 4, the location of the UMD campus is clear to this Guide's audience without further explanation.
- Ensure picture quality so the map is easily understood.
- Ensure that the font size in all labels is legible.
- Maps should contain a north arrow and, if necessary, a legend.
- Geographic extent is appropriate for audience and purpose. For example, the map in Figure 4 is suitable for UMD students and not explaining campus' location to those unfamiliar with Duluth.

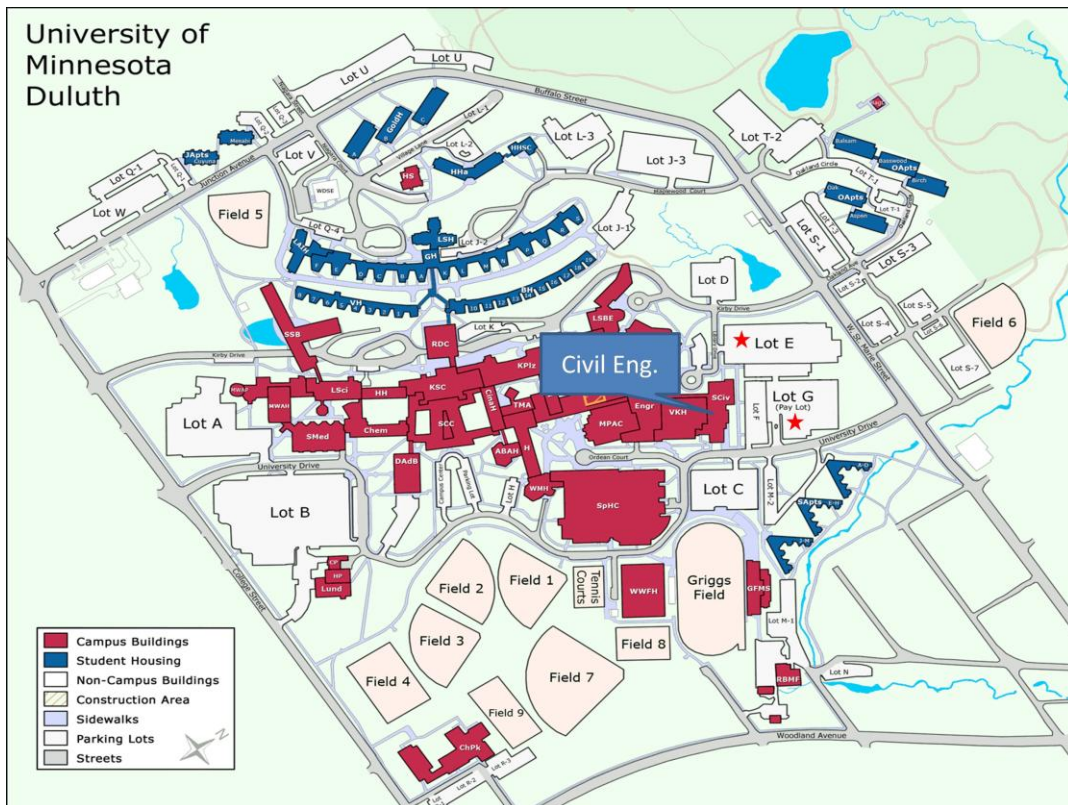

You should explain and reference all figures before the figure appears in your document. You should not assume that the audience will understand the figure before you explain it. Refer to the figures presented in this document and notice that each was introduced and explained prior to its appearance in the document.

Finally, figures should not contain titles. A caption should follow your figure. If a figure contains content that is not your work, you you need to cite the original source, as shown in Figures 2 and 3. It may be appropriate to cite the work in the legend or the caption. Refer to the section of this writing guide describing references for more details.

**Figure 3.** Bolted/welded double angle steel connection (AISC , 2011).

**Figure 4.** Location of Swenson Civil Engineering Building on UMD campus (UMD, 2015).

## Tables

The purpose of putting a table in a document is to improve the reader's understanding of the information presented. Tables offer a quick and easy way to present information that could otherwise be lost in the text. However, it is important to give adequate consideration to the necessity of the table. If it is not simplifying the relay of information, then it is not necessary. Specific guidelines follow:

- When using a table, be sure to reference the specific table in the text prior to the inclusion of the table.
- Note that tables and figures are numbered separately (Table 1, Table 2, Table 3, etc.). The tables should be numbered and labeled consistently as well and in order of their appearance.
- Refer to the table by the number assigned to it. For example, Table 1 shows the annual snowfall for three Minnesota cities from the winters of 2010-11 through 2013-14. It can be seen from Table 1 that Two Harbors gets on average more than ten inches of snow than either Duluth or Cloquet.
- It is important to explain the relevance of the table in the text.
- It is also very important to include any necessary references for the data in your table. These can be included in the caption, as shown in Table 1.
- Each table should have its own caption that includes both the table number and a brief caption explaining the contents of the table. The caption should be written such that the table could stand alone, without the rest of the text and still make sense.
- Captions for tables typically go above the table.
- Each column should have a heading that includes units.

**Table 1.** Annual snowfall in Duluth, Two Harbors and Cloquet, MN from 2010-2014 (Harrison, 2004).

City	Snowfall [in]				
	2010-11	2011-12	2012-13	2013-14	Average
Duluth	85	73	95	101	88.5
Two Harbors	94	82	114	121	102.8
Cloquet	79	69	101	99	87

Formatting of the tables is up to the author; however, consistency and organization are needed. Consistency means that all of the tables in a document should be arranged in a similar manner, with similar headings, titles, captions, font, font size, bold, italic, underlined text, double lines or darker lines, etc.

Similar to figures, you should explain and reference all tables before the table appears in your document. You should not assume that the audience will understand the table before you explain it. Refer to the table presented in this document and notice that it was introduced and explained prior to its appearance in the document.

## Equations

Equations used in calculations should be included in your report. Write the equation symbolically and define all variables, including units. Use the superscripts and subscripts where necessary. The equation should be discussed and cited in the body of the report prior to appearance of the equation. For example:

The flowrate in an aquifer can be calculated using the Darcy Equation (Equation 1):

$$Q = -KA(dh/dl) \quad (\text{Equation 1})$$

where

Q	= volumetric flowrate (m <sup>3</sup> /s)
K	= hydraulic conductivity (m/s)
A	= cross sectional area (m <sup>2</sup> )
dh	= change in hydraulic head (m)
dl	= change in distance (m)

## References and Citations

References, such as textbooks, journal articles, and design guides, are used to support your ideas in your writing. When using someone else's work, proper acknowledgement must be provided to avoid plagiarism. Plagiarism is presenting information or ideas from another source and representing it as your own without citing the original source. Some examples of plagiarism are not including quotation marks around an author's direct phrase from their original work or changing words in a sentence slightly and retaining the original form and style without citing the original.

To avoid plagiarism, use citations and references to properly acknowledge original material, including ideas, figures, or data. In-text citations and reference lists allow readers to locate and review the original source. The citation occurs in the text next to the referenced material and corresponds to a list of references provided at the end of the report. There are numerous citation styles including APA, MLA, and Chicago Style. The Kathryn A. Martin Library has a website with guides and information about the various styles <http://libguides.d.umn.edu/cite>. Typically, in the Civil Engineering curriculum, you will use APA style. Please check with your instructor for the style they require in their course.

In-text citations are generally of this form (last name, year). For a single author, the in-text citation is (last name, year), for two authors (last name 1 and last name 2, year) and three or more authors (last name 1 et al., year).

Example of an in-text citation

Arc Hydro is a data model and a set of tools developed to manage spatial and temporal data related to water resources in the ArcGIS environment (Maidment, 2002).

The above in-text citation would correspond to a reference provided in the reference list as follows:

Maidment, D. R. (2002). *Arc Hydro: GIS for water resources* (Vol. 1). ESRI, Inc..

## Reference List

The reference list is provided at the end of the report and is alphabetical by last name. If you have more than one paper by the same first author, they are then listed chronologically with the most recent reference first. Below are some common types of references.

### Journal References

Include year, Journal Title (in italics) volume, issue, and page numbers.

Peck, R. B. (1969). Advantages and limitations of the observational method in applied soil mechanics. *Geotechnique*, 19(2), 171-187.

### Books

Include author, book title, publisher, the publisher's location, and chapter title and inclusive page numbers if only a section of the book is used.

Hibbeler, R. C., Tan, K. H., & Nolan, B. (2006). *Structural analysis*. Pearson Prentice Hall.

Web Pages

Include author, year of publication or last revision, title of “page,” title of the complete work, Web address enclosed within angle brackets, and date material downloaded.

American Society of Civil Engineers (2014). “Author-Date References.”  
<<http://www.asce.org/Audience/Authors,-Editors/Books/General-Book-Information/Author-Date-References/>> (Sept. 15, 2014).

## General Rubric

The purpose of this general grading rubric is to familiarize you with the criteria Civil Engineering instructors will use to evaluate your writing. The example rubric shows definitions for each of the six main categories that instructors will evaluate. Within each category, instructors will define elements for evaluation and assign a grade value to each element. Elements of this rubric will stay the same but instructors may group elements or score differently based on assignment purpose and audience. Your written work in a professional setting will also vary based on purpose and audience. These elements will always directly relate to your audience and your purpose for writing.

		<b>I</b>	<b>II</b>	<b>III</b>
<b>Format (X points)</b>	Your assignment is presented according to published instructions.			
<b>Summary (X points)</b>	The audience for your work can understand the entire project by reading the summary. Depending on the audience, this may also be called an abstract, executive summary, or other titles.			
<b>Technical Content (X points)</b>	This will vary greatly by assignment. It includes correctly interpreting data, explaining results, reaching correct conclusions, presenting appropriate recommendations, effectively organizing and structuring the content according to the audience and purpose for writing.			
<b>Data Presentation (X points)</b>	Data is clearly presented to your audience when you include figures, tables, equations, example calculations, etc.			
<b>Conclusion (X points)</b>	The conclusion summarizes the entire document and clearly responds to the purpose, satisfying the audience that the purpose has been met.			
<b>Mechanics &amp; Style (X points)</b>	Mechanics refers to the conventions of edited standard written English, including spelling, punctuation, grammar, capitalization, use of numbers, etc. Style refers to the writing conventions used in the field of Civil Engineering, such as use of active voice, integration and citation of secondary sources, no use of first person, etc.			

Category I – met the criteria listed above with few/no issues (typically 100% of available points)

Category II – minor mistakes, but the criteria were still met (typically 75% of available points)

Category III – major mistakes distract from the criteria (typically 50% of available points)

Scores between each category are possible. Scores lower than those listed in Category III are possible if the content is largely missing or ignored.

### Example Writing Score Sheet (Y points)

Your instructor will adapt this rubric according to the emphasis of each assignment. The major categories will remain consistent from course to course. However, the elements emphasized within each area and the scoring associated with each element will vary by assignment.

		<b>I</b>	<b>II</b>	<b>III</b>
<b>Format (Z points)</b>	<ul style="list-style-type: none"> <li>Professionally formatted following published instructions (i.e. required sections, page numbering, margins, font, closing, appendices, etc.)</li> </ul>	Z	~0.75Z	~0.5Z
<b>Summary (X<sub>1</sub> points)</b>	<ul style="list-style-type: none"> <li>Problem leading to the report is summarized</li> <li>Method of solving problem is presented</li> <li>Results and their meaning are presented</li> <li>Summary includes all needed information for the audience to understand the report</li> </ul>

## Appendix A – Active vs. Passive Voice

General convention for professional civil engineering writing is to use active voice because it is more direct and concise. However, when deciding whether to use active or passive voice, consider if you want to emphasize or de-emphasize the agent (i.e., the actor or the do-er). For example, in a methodology section, the agent is often not important, which explains sentences such as “Soil samples were collected.” It does not matter who collected them, so it's not stated; the sentence is written in passive voice. An easy way to identify passive voice is this: If you can add the phrase "by civil engineers" to what you are writing, it is in passive voice. For example, “Once the preliminary test is completed [by civil engineers], a formal research proposal will be submitted [by civil engineers].” A worksheet adapted from a Writer’s Workshop handout providing more guidance on active vs. passive voice follows.

- Passive voice is *not* the same as past tense.
- Active voice places the agent (the person or thing doing the action) in the subject position.
- Passive voice places the object (the person or thing being acted upon) in the subject position.

Active	=	<u>Agent</u>	+	<u>Verb</u>	+	<u>Object</u>
		The engineer		completed		the design.
		Students		attended		the hydrology lab.
		The data		support		the recommendation.
		Dr. Hanson		made		mistakes.
Passive	=	<u>Object</u>	+	<u>Verb</u>	+	<u>Agent (if identified)</u>
		The design		was completed		by the engineer.
		The hydrology lab		was attended		by students.
		The recommendation		is supported		by the data.
		Mistakes		were made		(by Dr. Hanson. or <i>omitted</i> )

To identify passive structures look for:

1. The object in the subject position
2. A *be* verb (*am, is, are, was, were, be, being, been*) before the main verb
3. A main verb in past participle form  
(i.e., the word would fill these blanks: I have \_\_\_\_\_. It has \_\_\_\_\_.)
4. The agent or actor in a “by \_\_\_\_\_” phrase (or omitted)
